Influenza Update: July 25, 2020

During the week ending July 25, 2020:

- There were no new influenza-related deaths and no new outbreaks reported this week. Thirty-nine deaths and 27 outbreaks at long-term care facilities have been reported this season (since 9/29/2019).
- The percent of positive tests for respiratory viral pathogens at King County laboratories was below levels observed this time of year and below peak levels observed during the previous five seasons. COVID-19 testing is not currently included in laboratory reporting of respiratory pathogens.
- During the week ending July 25th, the percent of emergency department (ED) visits for influenza-like illness (ILI) was below baseline levels among all ages combined, and among each individual age group. Among every age group except for adults ages 65 years and older, the percent of ED ILI visits overall this season is at or above levels observed during each of the previous five influenza seasons. The percent of ED ILI visits has been highest among pediatric age groups, peaking at or above four of the previous five influenza seasons. This season, the percent of admissions for influenza has been highest among adults ages 65 years and older, but below levels observed during each of the previous five influenza seasons.

¹Based on King County hospital laboratory and sentinel provider submissions to CDC's National Respiratory and Enteric Virus Surveillance System (NREVSS).

Public Health - Seattle & King County Summary of Influenza Syndromic and Laboratory Surveillance

Weekly Percent of ED Visits for ILI by Year 2014 - 15 20.45 - 4820.48 - 172017-18 2018-2019-20 Baseline Percent 5 yr avg Current week 8 7 6 5 4 0 9 11 13 15 17 19 21 23 25 27 29 31 34 36 38 40 42 44 46 48 50 52 1 3 5 Meek

All ages Note: The change from ICD-9 to ICD-10 codes in October 2015 may impact trends. Last updated Jul 26, 2020 ; 'current week' is week ending Jul 25, 2020
Baseline: Mean % ILI during non-flu weeks for previous three seasons, adding two standard deviations. A non-flu week is a period of 2+ consecutive weeks where each one accounted for < 2% of the season's total number of specimens that tested positive for influenza by PCR.

ALLHOSPITALS, Last Updated Jul 29, 2020

National data from CDC

A Weekly Influenza Surveillance Report Prepared by the Influenza Division Influenza-Like Illness (ILI) Activity Level Indicator Determined by Data Reported to ILINet

2019-20 Influenza Season Week 29 ending Jul 18, 2020

*This map uses the proportion of outpatient visits to healthcare providers for influenza-like illness to measure the ILI activity level within a state. It does not, however, measure the extent of geographic spread of flu within a state. Therefore, outbreaks occurring in a single city could cause the state to display high activity levels.

"Data collected in ILINet may disproportionately represent certain populations within a state, and therefore may not accurately depict the full picture of influenza activity for the whole state.

*Data displayed in this map are based on data collected in ILINet, whereas the State and Territorial flu activity map are based on reports from state and territorial epidemiologists. The data presented in this map is preliminary and may change as more data is received

state aim terminal epideminolysis. In each presented in its map is pleniminally aim and raining as more data is received.

"Differences in the data presented by CDC and state health departments likely represent differing levels of data completeness with data presented by the state likely being the more complete.

"For the data download you can use Activity Level for the number and Activity Level Label for the text description.

Please report any of the following:

- Laboratory-Confirmed influenza-associated deaths
- Patients with novel or unsubtypable influenza viruses
- · Outbreaks of influenza-like illness in a long-term care facility
